
Freedom on the Internet

Wolf (s72785), Dresden University of Applied Sciences

Since summer 2013 the world is aware of illegal surveillance by *state agencies* around the world. They violate fundamental human rights justified by *false claims* like child protection, copyright, drug policy and fighting terrorism. And we all pay for it. So-called tin heads foresaw these things a long time ago already, warned at any occasion it was possible but have been widely ignored as conspiracy-nuts or mildly smiled at. *Money* makes the world go round, it *enables freedom easily*. And money is the main incentive for criminals as well as for industry controlled politics nowadays. The vast majority of people keep thinking that what has no price also is not worth much - mistaking gratis services for there is no price as well as high state currency values have to be worth much. January 2009 a new kind of money launched. First they ignore us, then they laugh at us, then we win. The network is the currency, transparent, pseudonymous, not eligible to direct regulation by banks nor governments - remaining controversial it enables freedom in financial transactions. The Inventors built asymmetric cryptography with the most durable methods found

at that time. *Bitcoin* for the first time in history *manages to solve the trust problem*. As many people do not understand the technical matters or have focus on state money still, by teaching about freedom rather than capitalization we want to make a difference. *Cryptography is no crime*. There can be *no freedom without risk and responsibility*. Now it is just the *owners holding the vital key* to control.
